## RESEARCH INTERESTS:

---

I retired in October 2021, having worked in magnetic resonance imaging technology and applications since 1983.

In 1987 I demonstrated a new method of imaging free radicals called Proton-Electron Double-Resonance Imaging (PEDRI) which combines electron spin resonance (ESR) with MRI. My 1988 paper on PEDRI has been cited 172 times (Lurie et al., J.Magn.Reson. **76**, 366-370 (1988); DOI: [10.1016/0022-2364\(88\)90123-0](https://doi.org/10.1016/0022-2364(88)90123-0)).

During the last 15 years of my career, my research concentrated on Fast Field-Cycling MRI (FFC-MRI). Standard MRI scanners operate at a single magnetic field, but FFC-MRI scanners have the ability to switch magnetic field rapidly during a scan, thereby obtaining information on the variation of the NMR relaxation times with magnetic field strength. Results indicate that this can provide a valuable new contrast mechanism for clinical MRI. In 2015 a consortium of seven research laboratories and two companies, coordinated by me, secured €6.60m (£5.92m) from the European Union's Horizon 2020 scheme to develop FFC-MRI as a clinical imaging modality; the "IDentIFY" project ran for 4 years from January 2016.
